Project Title:

LifeSphere AI: AI-Powered Adaptive Personal Life Record and Digital Asset Management Platform

Abstract:

The **LifeSphere AI: AI-Powered Adaptive Personal Life Record and Digital Asset Management Platform** is a web-based application designed to help users securely manage important personal documents, digital assets, subscriptions, warranties, and emergency information in one centralized platform. Users can upload and organize documents such as identity cards, passports, licenses, insurance documents, and certificates while receiving timely reminders for important expiry dates and renewals.

The system integrates **Artificial Intelligence** to extract important information from uploaded documents using **Optical Character Recognition (OCR)**, provide document summaries, and answer user queries through an AI-powered assistant. The platform also includes adaptive features based on predefined rules, such as dynamically prioritizing reminders, updating notifications according to urgency, identifying upcoming expirations, and providing temporary emergency access to authorized family members or nominees.

The system is developed using **React.js, Spring Boot, MySQL, Google Gemini API, Tesseract OCR, and JWT Authentication**. The proposed platform aims to provide a secure, intelligent, and user-friendly solution that reduces manual effort and helps users efficiently manage their important personal records and digital assets.
